

Implement the included mockup as a React app using the ES6 or higher standard. Use the API of any free weather service to show real time weather for three cities of your choice (yahoo, openweathermap, theweathernetwork, etc). Use React classes for any stateful components.

The app should be fully functional and respond appropriately to user events. Use Less with modern CSS properties, such as Flexbox, where appropriate. You may choose to use the included icons, or use icons from an alternative pack (eg. Fontawesome).

Upload your code to a git host such as Github or GitLab and make sure the repo is publicly visible. Deploy the app to any public facing web host like Heroku so we can see a working demo.

We will be looking equally for well structured code, good use of ES6+ features and accuracy of the implemented mockup.
